Case Study

Shopee.sg

1. In real life, business analysts gather requirements on the system that they are going to implement. As such, they usually start the whole purpose by speaking to the various stakeholders. However, to help you better appreciate what use cases are, we will do some reverse engineering in this tutorial. Suppose the system you are building is shopee.sg. To keep things simple, we will just mainly focus on the consumer (buyer) related operations¹. Come up with an exhaustive list of use cases of the buyer for the shopee.sg system.

¹ The Shopee SG should involve other types of users such as the Shopee administrators, sellers on Shopee, logistic department (for Shopee Mall “sellers”, etc).
