

Business Model

Introduction

Easy Rewards (ER) is a reward-based shopping platform to encourage shopper shops at the partner merchants, which is similar with Shopback. Shoppers browse ER website to see advertisements, search items and redirected to the merchant with affiliate link. The partner merchant can set rebate for each order, which ER platform will provide ER Credits after complete order. The ER Credits can be used to redeem e-vouchers, or withdraw as cash. The whole platform mechanism is to increase user loyalty and activity on the platform.

Reward Mechanism

The reward mechanism of the ER platform is designed to be very flexible. Users not only get a certain percentage of ER points back after making purchases, but also the value of these points will increase when they are exchanged for e-coupons from partner merchants. This mechanism is designed to stimulate users to shop more frequently on the ER platform, and at the same time, encourage them to choose to redeem their points instead of withdrawing them directly.

Merchant Partnership

The ER Platform partners with various merchants to increase their exposure and sales by providing a centralised reward system. Merchants need to agree to provide a certain percentage of rebates when users purchase goods through ER platform links. This not only helps merchants attract traffic from the ER platform, but also enhances customers' willingness to buy through the reward mechanism. In addition, merchants can further enhance their brand awareness by participating in the platform's promotional activities.

Advertisement

Easy rewards' profit model is based on advertisements, in addition to the revenue it draws from the merchants it partners with. er has advertisements on the homepage, search page, and product details page of the site. There are two types of advertisements on the homepage, one of which is a front-page advertisement that scrolls down the centre of the homepage, and the other is a small advertisement of the merchant's products that is placed below the front-page advertisement. Advertisements on the search page are implemented by providing "recommended products" in the first few items of the user's search results. Adverts for "similar products" are also displayed at the end of the product details page. These adverts will greatly increase the exposure of the merchant and their products, bringing higher sales and purchase rates to the merchant.

Users

Users need to register for an account when they first use the platform, and they can start using it after passing the email verification. The platform provides a simple and easy-to-use interface for users to browse various merchants and their rebate offers. Once a user selects a link to a merchant's website and completes a purchase, ER Points are recorded and

credited to the user's account upon confirmation of the transaction. Users can also receive regular marketing emails through the platform for the latest deals and offers.

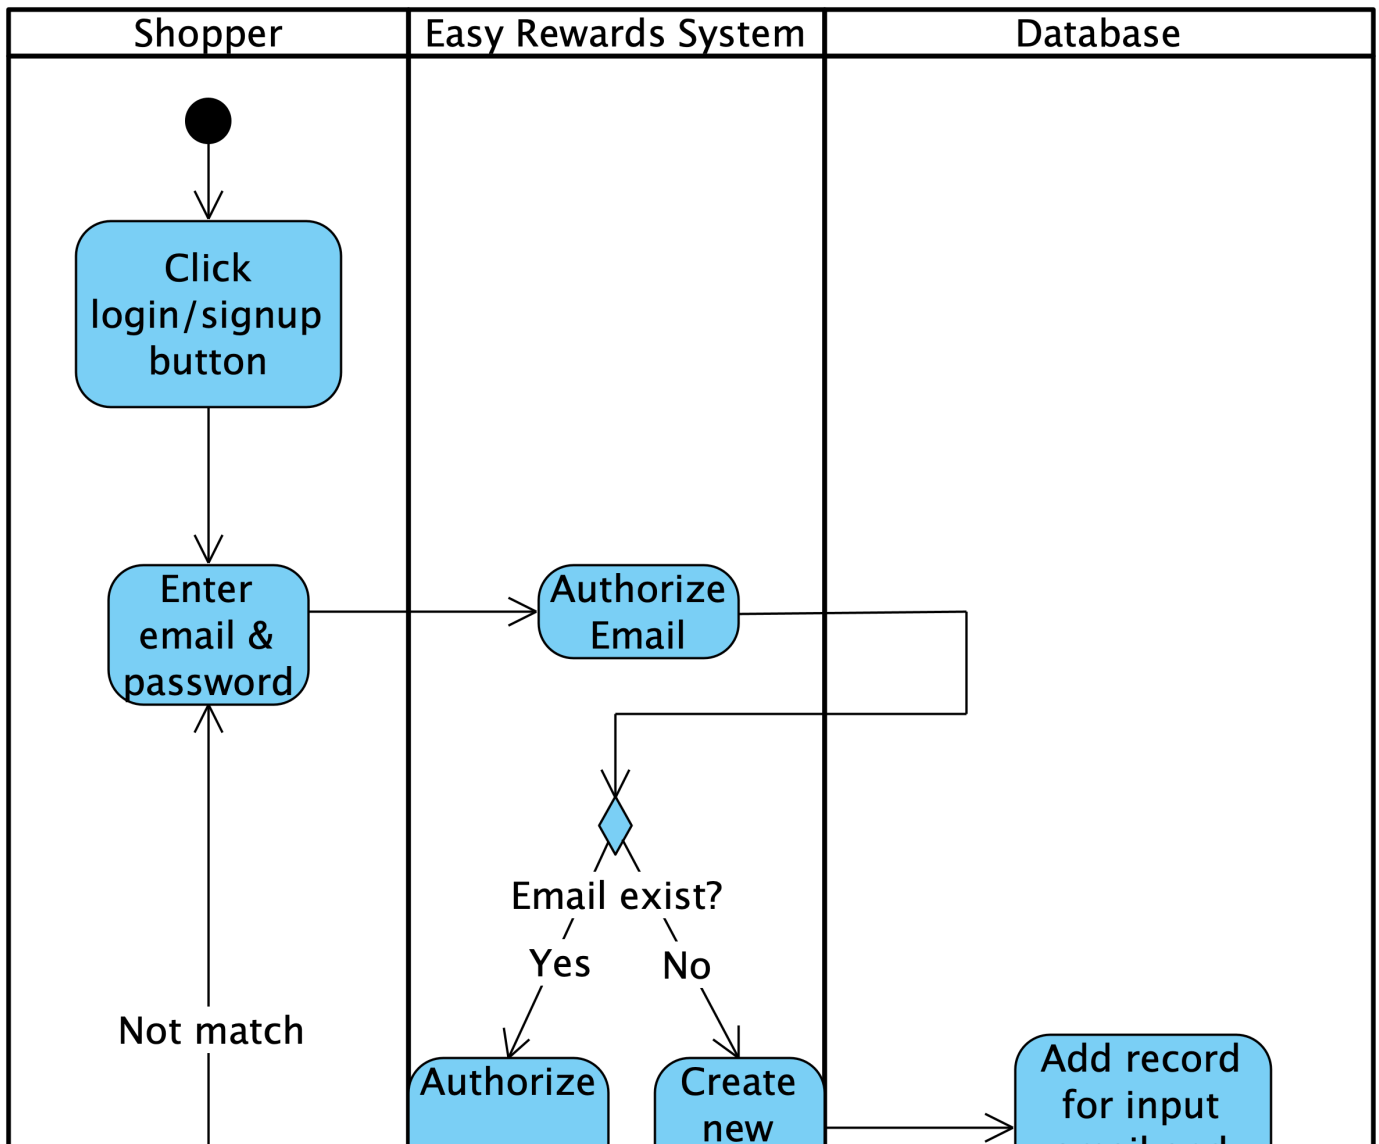

Market Positioning

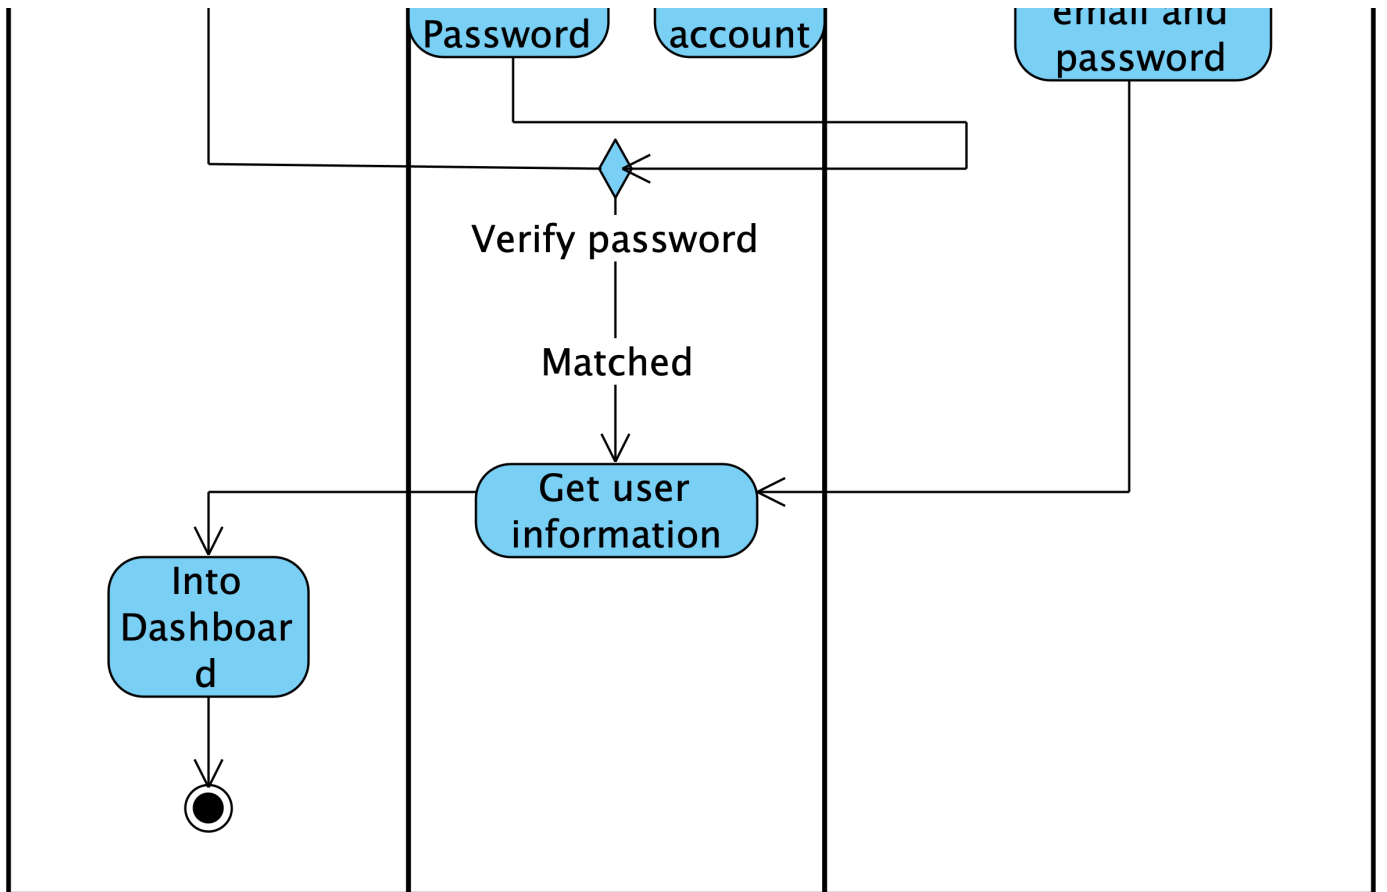

The ER platform is targeted at frequent online shoppers, especially those looking for extra value and offers. By continuously optimising the user experience and expanding with more partner merchants, ER plans to increase its market share in the coming years. The platform also plans to develop mobile applications so that users can access the services more conveniently on mobile devices, thereby further increasing user activity and platform stickiness.

Main Business Process

Shopper (User) Login or Signup

The user first needs to create an account through the registration process on the ER platform. During this process, the user needs to provide basic information such as name, email address, and password. When the user logs in, the platform ensures the legitimacy of the login behaviour through a secure authentication mechanism, and also provides auxiliary functions such as forgetting the password to help the user solve the login problem.

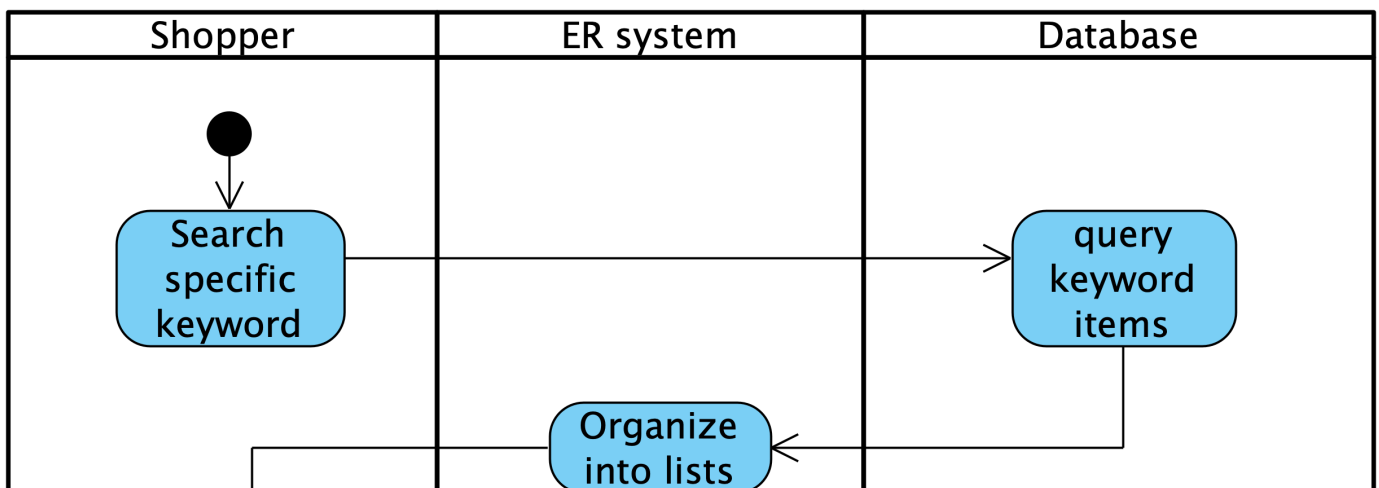

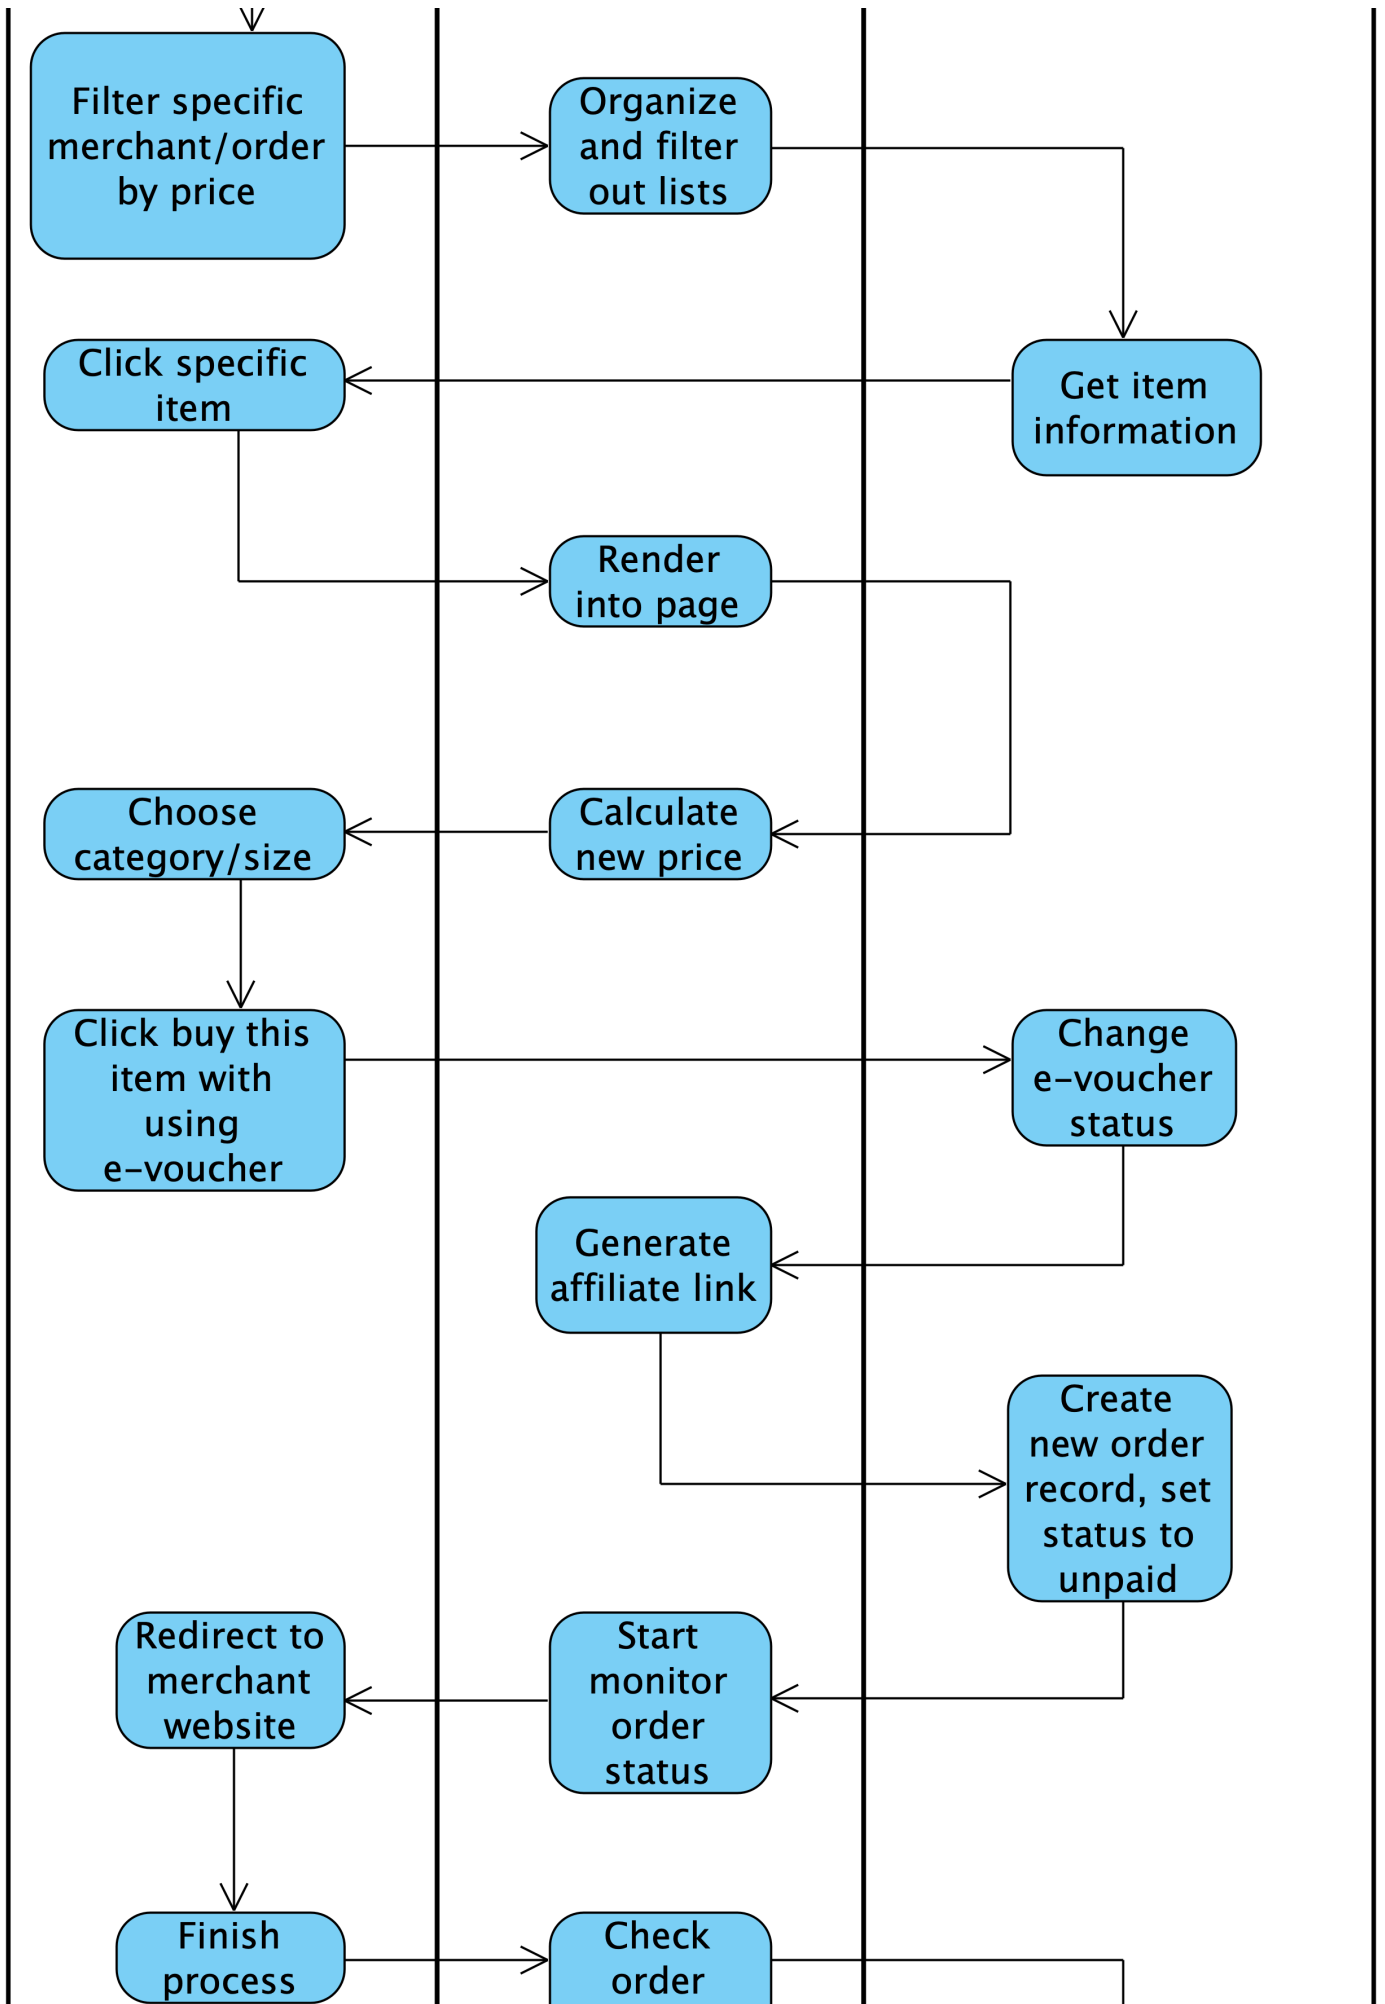

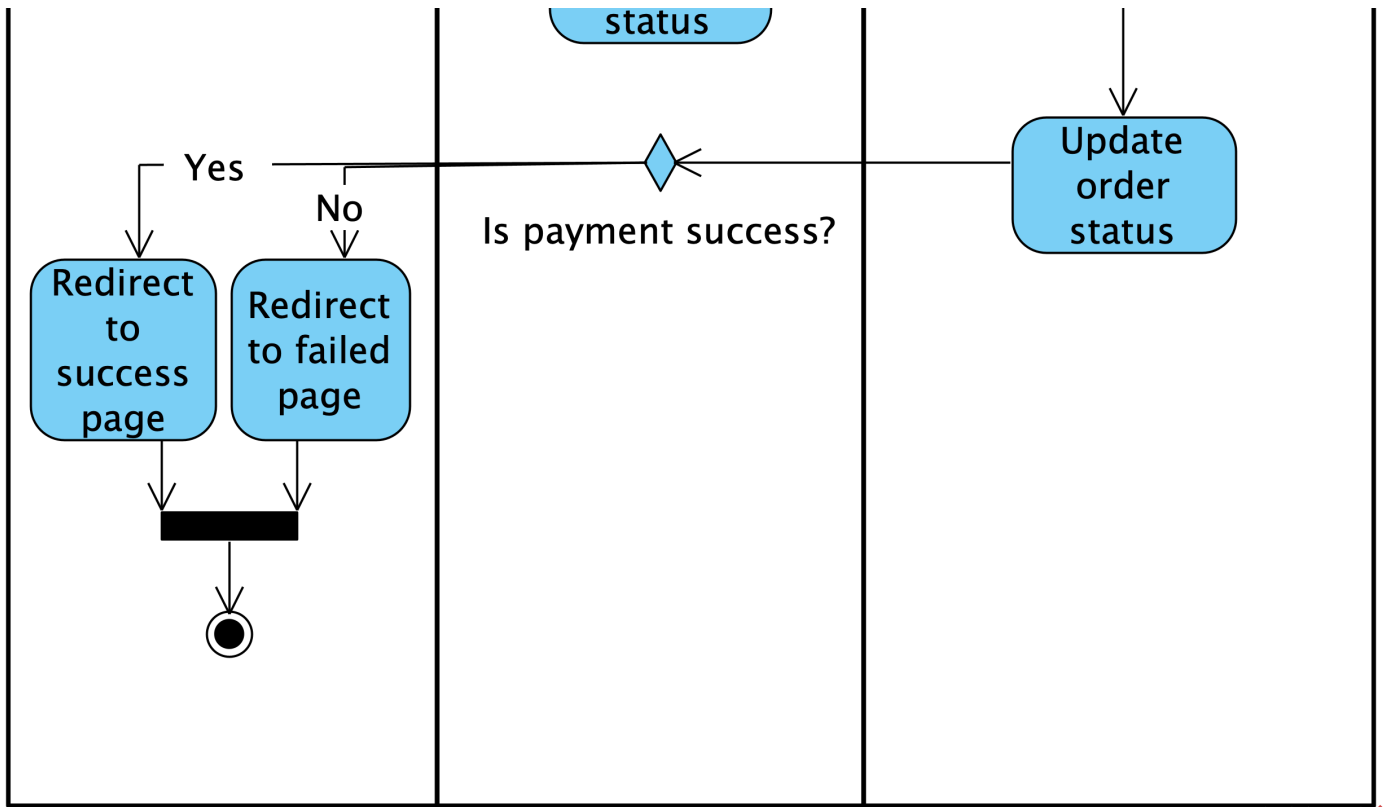

Shopper browser merchants and items, then buy items

Once logged in, users can view different partner merchants and their promotions on the ER platform. The platform is designed with an intuitive user interface that allows users to search and filter merchants based on category, intensity of offer or other criteria. Each merchant page details the percentage of ER points that can be earned as well as specific shopping conditions. By clicking on a specific ER link, users can be redirected directly to the merchant's website, ensuring that their shopping activity is tracked and recorded by the ER platform.

Once a user jumps to a merchant's website through the ER platform, any purchases completed on that site will be recorded through ER's tracking system. This system ensures that all transactions made through ER links are tracked so that points can be calculated correctly. At the end of the purchase process, the system alerts the user that the purchase was successful and notifies them that they will receive points in the future.

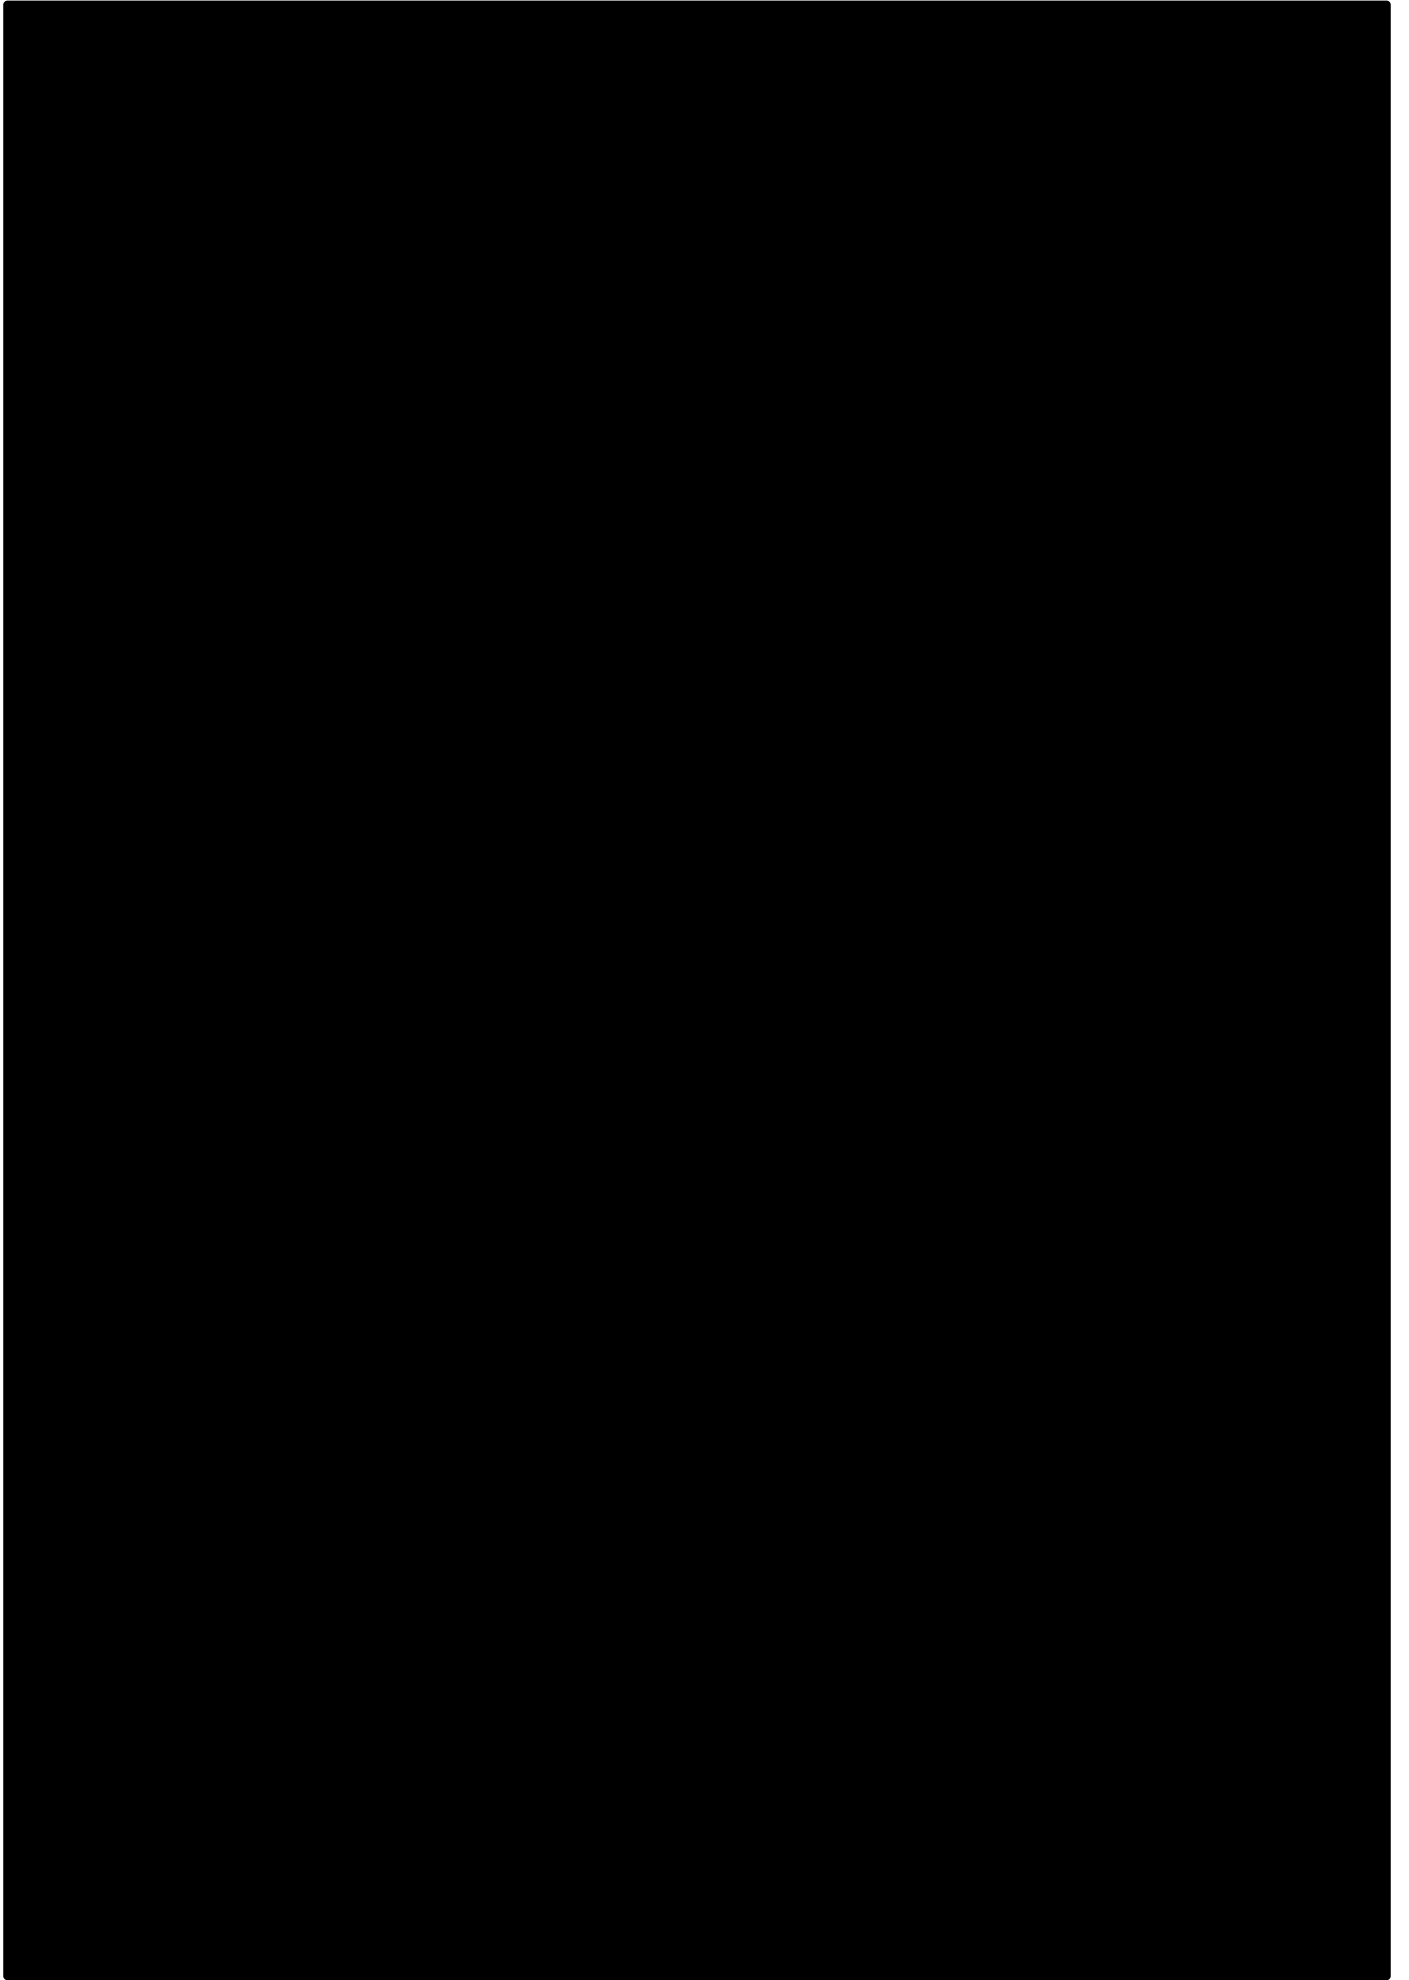

ER Credits confirmation

The corresponding ER points are not issued immediately after completing the purchase, in case the user cancels or returns the order. Once the status of the order is confirmed, for example after the return period, the system automatically credits the user's ER account. This mechanism ensures the economic security of the ER platform and prevents potential fraud. Users can view the status and history of points accumulation in real time in their account.

Shopper redeem credits

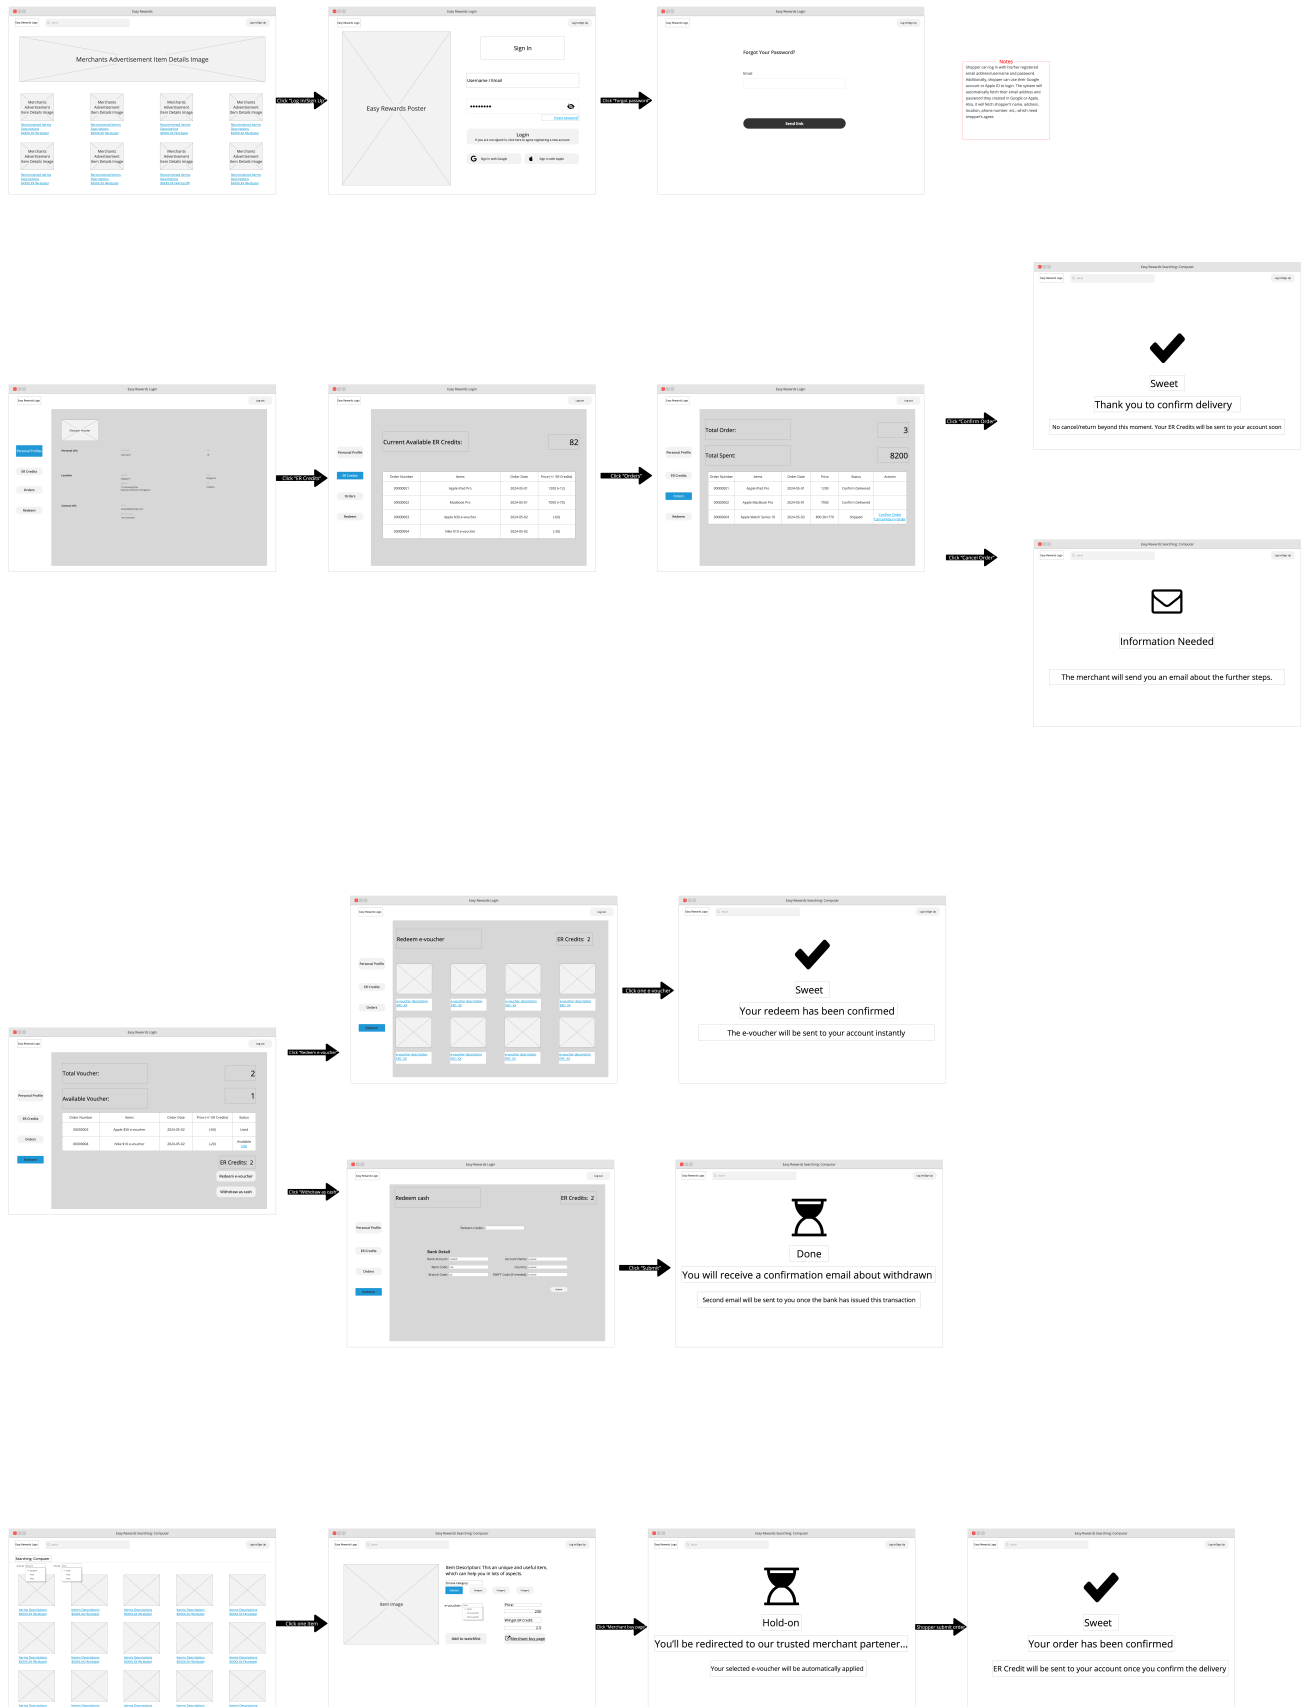

After accumulating points to a certain level, users can choose to exchange these points for e-coupons or withdraw them for cash. The redemption process is very simple. Users simply select the coupon they wish to redeem or enter the amount they wish to withdraw on the platform, and the system will process these requests. Vouchers can be used for future purchases at partner merchants or on the ER platform, while cash withdrawals are transferred directly to the user's designated bank account.

Interactions between different stakeholders

Shopper

Shopper: interact with the system mainly through the interface and participate in purchasing, points accumulation and redemption activities.

- **Webpage View:** The following graph shows the webpage view of the shopper.
 - The first logic is shopper access the main page of the ER website, and use his/her credentials to login. In case shopper forgot password, the reset password function has been given.
 - The Second logic is after shopper login to the account, shopper can access four functions left hand side shows. The personal info, ER Credits and orders. For incomplete orders, shopper can cancel/return order, or confirm the delivery.
 - The third logic is to redeem the ER credits. There are two options that shopper can redeem, cash or e-vouchers. For e-vouchers, shopper can select the available vouchers on a table, then pay the credits for voucher. For cash, shopper is requested to enter bank details.
 - The last logic is shopper browsing and re-directing to the merchant website. The ER website allows shopper to select different size, categories for items, to let shopper can pay the item faster.

- **Mobile app view:** The following diagram shows the wireframe of the mobile app view. Which logically similar with the webpage.

Merchants

Merchants: work with the ER team to gain more customer exposure through the platform. Merchants need to set the reward percentage on the platform and bear a portion of the sales revenue as cost.

- Merchant have a webpage to login to their merchant account. In the dashboard, the merchant manager is allowed to manage the items they listed on ER, the e-voucher they submitted to let shopper redeem, and manage the orders relates to their items.

ER Administrator

ER Administrator: Manage the operation of the entire platform, including the management of users and merchants, e-voucher, orders, and the management of the advertisement.
